1 WEEK PROTECT

WHAT ADVANTAGES DOES DUOPRAZOL HAVE OVER OTHER OMEPRAZOLE PASTES?

The typical treatment for a horse using oral Omeprazole pastes requires 2,28 – 2.40 grams daily, which amounts up to 16 grams per week. This imposes a significant metabolic strain on the animal.

DUOPRAZOL only includes 5,25g of full-active Omeprazole per week -thanks to a specially designed controlled-release carrier that adheres to the digestive tract, allowing for slow and sustained delivery-. Additionally, the combination with Sodium Bicarbonate not only helps to instantly improve stomach pH but also protects the Omeprazole from degradation.

In this way, DUOPRAZOL enhances the effectiveness of Omeprazole, reducing the horse's metabolic load by up to 66% compared to other Omeprazole pastes. Additionally, it minimizes veterinary intervention, requiring application only once every three days instead of daily.
